

CASE STUDY

The Eden Project, St Austell

From a clay pit to a world famous visitor attraction and educational charity, Dart Valley Systems have been working with the Eden project for over 10 years, to help them reduce their water usage.

Since it opened in 2001 the site has continued to expand, and with it, the number of DVS products installed have followed with its success. The WC Flushvalves and Down lighter Urinal Controls have already become a specified product for the Project, with a trial of our New Intelligent Taps planned later this year.

The flushvalve was chosen not only for water saving but for its user friendly hygienic no-touch operation, which is ideal for the high number of elderly and disabled visitors using the facilities every year.

The Urinal Controls were chosen as they have variable settings to allow adjustable time delays between flushing, and are low maintenance.

DVS Engineers have so far installed these products in several areas across the site including The Core and Link. DVS will continue to work with the attraction for many more years to come...
